### 1. Introduction

i made a project on banking system which operates some bank operation like withdraw, deposit and check balance while withdrawn. This project includes user friendly interfaces and user input handling, conditional logic, loops, and basic financial transaction processing. the system helps the bank to manage all the things easily and in very less time.

### 2. Problem Statement

There is a need for a simple, accessible banking system that allows users to perform basic transactions without unnecessary complex thing so that they will not confuses any more . This project addresses the need for:

- 1 Quick access to banking operations
2. Simple user interface for all age groups
3. Basic transaction processing capabilities
4. Educational tool for understanding banking operations

### 3. Functional Requirements

- **User Authentication:** verifies the account of user and verifies name
- **Deposit Functionality:** allows to deposit users money easily
- **Withdrawal Functionality:** allows to withdraw user money with balance checks
- **Balance Inquiry:** Provide account statement in every step except exit
- **Transaction Validation:** Ensure all transactions are valid and within limits
- **User-friendly Interface:** interface is kept very user friendly so there is no thing where user face difficulty
- 

### 4. Non-functional Requirements

Performance:

Reliability:

Usability:

Security:

Maintainability:

Portability:

## 7. Design Decisions & Rationale

### Technology Choices

- **Python:** Selected for its simplicity
- **Console Interface:** Chosen for simplicity and focus on core logic
- **In-Memory Storage:** Used for prototype demonstration; easily replaceable with database

### Architectural Decisions

- **Input Validation:** user can input their money in withdraw and deposit cases
- **Error Handling:** Comprehensive exception handling for user-friendly experience

## 9. Implementation Details

```
def main() -> None:
    name=input('enter account holders name')
    acc_number=int(input('enter your account number'))
    if acc_number==12345:
        balance=23410
    elif acc_number==23456:
        balance=89023
    elif acc_number==469978:
        balance=33200
    elif acc_number==74978:
        balance=11003

    print(name,'welcome to our bank')
    #balance = 6666760.0 # Initialize balance

    while True:
        print("\n---BANKING SYSTEM---")
        print("1. Deposit")
        print("2. Withdraw")
        print("3. Check balance")
        print("4.Exit")

        choice =input("choose option")

        if choice == '1':
            amount=float(input("ENTER amount"))
            if amount>0:
                balance=balance+amount
                print("amount deposited successfully",amount)
                print("amount balance ",balance)
            elif choice == '2':
                amount=float(input("ENTER amount want withdraw"))
                if amount<= balance:
                    balance = balance-amount
                    print('your amount',amount,' withdran sussefully\n ')
                    print("amount balance ",balance)
                else:
                    print("insufficient balance")
            elif choice == '3':
                print('Checking your balance')
                print("YOUR BALNCE IS :",balance)
            elif choice=='4':
                print("exiting your bank project. goodbye")
                break
            else:
                print("not getting any command, try again")

    main()
```

### Key Features Implemented

- Account verification system
- Transaction validation
- Balance management
- User session handling
- Input sanitization

## 10. Screenshots / Results

```
PS C:\code,s> python -u "c:\code,s\.vscode\b management system.py"
enter account holders nameHappy
enter your account number74978
Happy welcome to our bank

---BANKING SYSTEM---
1. Deposit
2. withdraw
3. Check balance
4.Exit
choose option1
ENTER amount2345
amount deposited sucessfully 2345.0
amount balance 13348.0
```

```
---BANKING SYSTEM---
1. Deposit
2. withdraw
3. Check balance
4.Exit
choose option2
ENTER amount want withdraw3267
your amount 3267.0 withdran sussefully

amount balance 10081.0
```

```
---BANKING SYSTEM---
1. Deposit
2. withdraw
3. Check balance
4.Exit
choose optionpython -u "c:\code,s\.vscode\b management system.py"
not getting any command, try again

---BANKING SYSTEM---
1. Deposit
2. withdraw
3. Check balance
4.Exit
choose option2
ENTER amount want withdraw3267
your amount 3267.0 withdran sussefully

amount balance 10081.0

---BANKING SYSTEM---
1. Deposit
2. withdraw
3. Check balance
4.Exit
choose option3
Checking your balance
YOUR BALNCE IS : 10081.0
```

```
---BANKING SYSTEM---
1. Deposit
2. withdraw
3. Check balance
4.Exit
choose option3
Checking your balance
YOUR BALNCE IS : 10081.0

---BANKING SYSTEM---
1. Deposit
2. withdraw
3. Check balance
4.Exit
choose option4
exiting your bank project. goodbye
```

## 11. Testing Approach

### Test Cases Executed

#### Account Verification

- Valid account number
- Invalid account number

#### Deposit Functionality

- Positive amounts
- Zero amount
- Negative amount (error case)
- Non-numeric input (error case)
